                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel multimeric cytomegalovirus (CMV) antigen
infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel human proteases of the invention.
                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multimeric cytomegalovirus antigen useful as an immunoassay reagent, and which comprises at least two p52 peptide sequences
                                                                                                                                                                                                                                                                                                                                               CMV-p52 antigen; multimeric; immunoassay; IgM; immunoglobulin M; diagnosis; infection; reactivation.
                                                                                                                           5

Patent No. 525463
GENERAL INFORMATION:
APPLICANT: 2019, Werner
TITLE OF INVENTION: Methods and reagents for detection of
TITLE OF INVENTION: pathogens using superoxide dismutase gene
TITLE OF INVENTION: targeting
NUMBER OF SOURNES: 44
CORRESPONDENCE ADDRESS:

                                      The sequence is that of an example randomising oligonucleotide which is used in the prepn. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SPERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol. function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone action and as catalysts. SPERT is used to select novel polypeptides that bind the antibody of the epitope commonly recognised by the antisera from autoimmune at al., 1 Immunol. 144, 4613, 1990). The known epitope consists of ca. 10 amino acids at the N-terminus of the histone H2D consists of ca. 10 amino acids at the N-terminus of the histone H2D protein. To make mRNA encoding candidate polypeptides a 5' fixed protein. To make mRNA encoding candidate polypeptides a 5' fixed sequence composed of a 77 promoter sequence and a ribosome binding sequence composed of a 77 promoter sequence and a ribosome binding sequence composed of a 77 promoter sequence and a ribosome binding terminating in a restriction endouclease site is synthesised and cloned terminal trailer sequence of ca. 100 nucleotides lacking stop codons. The addition, a 3' primer annealing site is provided so that cDNA calborane complished on the mRNA recovered from partitioned calborane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   168

The present sequence was used in an example illustrating an invention relating to a method for isolating a polypeptide ligand for a desired target molecule. The method involves synthesising a nucleic acid mixture comprising mRNA having translatable each on-translatable regions and a mixture of nucleic acid polypeptide copolymers, each comprising the mRNA and a polypeptide encoded by its associated mRNA. The copolymers are partitioned relative to their affinity to the target. The method is termed systemic polypeptide evolution by reverse translation (SPERT). The polypeptide signal molecule targets are useful in assay methods, diagnostic procedures, cell sorting, as inhibitors of target. Normone action and have therapeutic uses as sequestering agents. The target molecules include natural and synthetic polymers, including proteins, hormones, receptors and cell surfaces, nucleic acids and small collecules such as drugs, metabolites, cofactors and toxins. Polypeptide and rapidly identified by this method.
                                                                                                                                                      Isolating a polypeptide ligand to a target molecule, useful for diagnostic assays, comprises partitioning candidate mixtures comprised of thosome complexes or mRNA.polypeptide copolymers relative to the target molecule
                                                                           Smith JD;

a

The sequences given in AA172769-81 are oligonucleotides which were used to make mRNA encoding a candidate polypeptide, a 5' fixed sequence composed of a 77 promoter sequence and a ribosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes, terminating in a restriction endonuclease site. The resulting nucleic acid was used in a restriction endonuclease site. The resulting nucleic acid was used in the method of the linvention for preparing ligands of target molecules complexes or mRNA.circle-solid.polypeptide in which mixtures of ribosome complexes or mRNA.circle-solid.polypeptide copolymers (mRcs.pCs) are partitioned by affinity to the target and amplified to create candidate mixtures enriched in ribosome complexes or mRCs.pCs with an affinity to the target, are new. The methods are useful for isolating polypeptide in ribosome complexes or mRcs.pCs with an affinity to the target, are new. The methods are useful for isolating protecting polypeptide products are useful for assay methods, diagnostic procedures, cell sorting, as inhibitors of the aspert methods diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as sequestering agents and the carget molecule function, as probes, as sequestering agents and the carget molecule and protectins, polysaccharides, glycoprotectins, bormones, clarget molecule sinclude natural and synthetic polymers, including protectis, polysaccharides, glycoprotectins, bormones, creeptors and cell surfaces, nucleic acids, and small molecules such acts as manageds and the novel SPERT method involves utilizing a candidate polypeptides are copypeptides having a randomized amino acid sequence. Each member of the mixture is linked to an individualized mNNA, which encodes the partitioned according to their property of binding to append according to their property of binding to agree and the mRNA encoding a polypeptide is partitioned each mixture of the mixture is linked to an individualized of the copypeptide and the mRNA encoding New methods (termed SPERT (Systematic Polypeptide Evolution by Reverse Translation)) for selecting high-affinity polypeptide ligands that specifically bind target molecules, e.g. proteins, carbohydrates, toxins, drugs and receptors Smith JD; Example 1; Page 21; 38pp; English.                                                                                                                                         342
                                                                                                                                                                                                 The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen.
Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains COC 1551 (AAI99683) and H37Rv (AAI99682). The method is useful for evaluating strain variation G. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Evaluating strain variation of Mycobacterium tuberculosis, comprises determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=6294328B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen.

Mycobacterium tuberculosis or related Wycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1531 (AA199683) and H37Rv (AA199682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 4411529 BP; 758565 A; 1449983 C; 1444602 G; 758379 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ωναιυατιπg strain variation of Mycobacterium tuberculosis, comprise determining the nucleotide sequence of the strain at positions in th genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ
                                                                                                                                                 Mycobacterium tuberculosis; strain H37Rv; strain CDC 1551; genome; variation; epidemiology; patient treatment; epidemic monitoring; ds

The protein is expressed in the central nervous system. The SRBB products are used for the diagnosis and treatment of diseases of the central nervous system, including inflammatory disorders of immunological origin.

                                                                                                                                                                                                                                                                                                                                                                                                                                     orphan G protein coupled receptor (GPCR), expressed in foetal brain, putamen, pituitary gland and caudate nucleus. The hGPCR27 CDNA was identified using EST (expressed sequence tag) AA778870 as a probe. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue formation expression analysis to provide information about their formation about their formation about their formation and their formation and their formation about their formation and their formation about their formation and the formation and their formation are and the formation and their formation are and the formation and their formation are also and the formation are and the formation and their formation are and the formation and their formation and their formation are and the formation are and the formation and their formation are and the formation and their formation are and the formation and their formation are and the formation and the formation are and the formation are and the formation and the formation and the formation are and the fo

The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02855 to AAB02859 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     156

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of identifying an agent that binds to and/or modulates activity of human G-protein coupled receptor (GPCR) 14266. The invention also provides a method for modulating the level or activity of the GPCR in cells in vivo or in vitro, or in a subject predisposed to having a haematopoletic or neutrophil deficiency disorders. Detecting 14266 polypeptides or nucleic acids in specific conjugical samples is useful in disease diagnosis. Modulating level or activity of the GPCR polypeptide or polynucleotide is useful for treating spleen (e.g. splenomegaly, neoplasms); lung (e.g. vlainmonary hypertension, complysems); colon (e.g. diarrhoea and dysentery, idiopathic inflammatory cendometrium (e.g. endometrials); utral hepatitis); uterus and conte meningitis, multiple sclerosis, spinocerebellar degeneration); cacute meningitis, multiple sclerosis, spinocerebellar degeneration); crells (e.g. systemic lupus erythematosus, polyarteritis nodosa); skin (e.g. vittiligo, acanthosis nigricans); heart (e.g. heart failure,

                                                                                                      The invention relates to an isolated polypeptide encoded by a nucleic acid molecule that is at least 80% identical to the G nucleic acid molecule that is at least 80% identical to the G rucleic acid molecule that is at least 80% identical to the G protein-coupled (GPCR) polynucleotides included in the specification.

CC Also included are probes based on the GPCR sequences (including antisense probes), a host cell comprising an expression vector comprising can methods of identifying modulators of the polypeptides. The polypeptides are useful for identifying modulator compounds which compounds which is a modulators, activators, repressors, agonists or antagonists of the propeptides and nucleic acid probes as described above can be used to detect the presence of the polypeptides and nucleic acid searched in which GPCRs are involved compounds and area to dispenses a variaty of diseases or disporaters in which GPCRs are involved componsarroma, chronic obstructive pulmonary disease, cohonforsarroma, chronic obstructive pulmonary disease, cohonforsarroma and arthitis, schizophrenia ulcerative colitis, tuberculosis and many other diseases listed in the specification. The probes and antibodies are also useful for diagnosing cognition and memory disorders, many near many mentonicy disorders. Anonexia, hormonal release disorders, cardiovascular activity disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     277 ACGGCTTCGTGGTGCGCGAGACCAGGGTCGAAGAGACACATCAACACCTGCACCGGCGAGG 336

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, coding and non-coding regions, intron-exon borders, the intration codons, genomic flanking regions, intron-exon borders, the silend, the 3'-end and the juxta-section between coding and non-coding comparison of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target conjugated specifically AAX5180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and including lung diseases, pulmonary vasoconstriction, inflammation, including lung diseases, pulmonary vasoconstriction, confit in a larget chinitis, acute asthma, allergies, asthma, impeded confirmant bull of the sease (OPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, lepatic metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                              pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiration; allergy; asthma; impeded respiration; respiration; pulmonary distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides used in treatment of, e.g. pulmonary

(see also AAR92692). It was obtd. by amplification of the cloned isoamylase gene (AAT10428) using primers (AAT10423.33) designed to add a start codon to the beginning of the processed mature enzyme (Ala-33) and a stop codon adjacent to the endogenous TGA codon. The DNA sequence is used for the recombinant prodn. of isoamylase or can be expressed in transgenic plants, e.g. potato, cassava, sweet potato, corn, wheat, barley or rice, to alter the amylose:amylopectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated DNA encoding isoamylase - used to produce plants having a modified starch content, e.g. a higher ratio of amylose to

The protein can be used to produce higher amylose starches, using genetically modified plants.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Genes were predicted from the integrated results of the following:
GENSCANI. O. BLASTNZ. O. as well as SplicePredictor
(October 1998 version). The genomic sequence was searched against
NCBI NonRedundant Protein database, nr
(ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at
RGP. Protein homologies of the coding regions were searched against
the identified cDNA sequences using BLASTNZ. O. with the
corresponding DDBJ accession no. and RGP clone ID.
A gene with identity or significant homology to a protein is
classified based on the protein name to indicate the homology covering
significant homology to any protein but with EST homology (covering
slagificant homology to any protein and T7 to SPG of the PAC clone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 **NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and the accession number will be preserved.

* 53114 53213: contig of 53113 bp in length

* 53214 172404: contig of 53119 bp in length

* 172505 172504: gap of unknown length

* 172505 174218: contig of 1714 bp in length

* 172505 174218: contig of 1714 bp in length

On Oct 17, 2001 this sequence version replaced gi:1343001.

Genes were predicted from the integrated results of the following: GENSCANI, O, BLASTNA.O, BLASTNA.O, as well as SplicePredictor (October 1998 version). The genomic sequence was searched against (October 1998 version). The genomic sequence was searched against NCBI NonRedundant Protein database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the CDNA sequence database at RGP. Protein homologies of the coding regions were searched against NCBI NonRedundant Protein database with BLASTPS.O. ESTS represent the identified cDNA sequences using BLASTPS.O. With the corresponding DDDJ accession no. and RGP chone ID.

A gene with identity or significant homology to a protein name to indicate the homology level such as same name, 'putative' and 'like protein. A gene without significant homology to any protein but with EST homology (covering almost the entire length of partial sequence) is classified as an 'hypothetical' protein.

The orientation of the sequence is from SP6 to 77 of the PAC clone. The partial and information on one and assembly cnality tocether with next all and information on one and assembly cnality tocether with and assembly cnality and assembly cnality and assembly consistent workers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       join(10813 ..10841,11094 ..11205,11289 ..11432,11817 ..11921,

* NOTE: This is a "working draft' sequence. It currently

consists of 4 contigs. Gaps between the contigs

are represented as runs of N. The order of the pieces

are represented as runs of N. The order of the pieces

to the gaps between them are based on estimates that have

provided by the submittor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic of Bibb et al., Gene 30:157-66(1984) and the FramePlot program http://www.nih.go.jp/
jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             correct initiation codon. Where possible we choose an initiation codon (atg) qtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid 3A7 lies between 10H5 and 4A2 on the Asel-B genomic restriction fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacteria; Firmicutes; Actinobacteria; Actinobacteridae;

LOCUS

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the Framewellot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/Cgl-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Jif this cannot be identified we choose the most initiation codon. If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most initiation codon. If way be shorter because we arrange for a sequence overlapping sections once, or Ionger, because we arrange for a small overlap between neighbouring submissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given prediction is based on positional base preference in codon. Gene specially developed Hadden Markow Model (Krogh et al., Nucleic Acids Research, 22(22):4769-4778(1994)) and the Frameplot program http://www.nih.go.jp/
Un/C91-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation ribosome binding site sequence (optimally 5-13bp before the most important initiation codon). If this equance (optimally 5-13bp before the most important initiation codon). If this commot be identified we choose the most important initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence everlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid C30 overlaps cosmid C75 on the Asel-C genomic restriction fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Complement(681. 1661)

On Mar 12, 2002 this sequence version replaced gi:16904696.
Genes were predicted from the integrated results of the following:
GENSCANI.0, BLASTNZ.0, BLASTNZ.0 as well as SplicePredictor
(October 1998 version). The genomic sequence was searched against
NCBI NonRedundant Protein database, nr
(ftp://ncbi.nlm.nh.gov/blast/db) and the CDNA sequence database at
NCBI NonRedundant Protein database, nr
(ftp://ncbi.nlm.nh.gov/blast/db) and the CDNA sequence database at
NCBI NonRedundant Protein database with BLASTPS.0. ESTS represent
corresponding DBDJ accession no. and RGP clone ID.
A gene with identity or significant homology to a protein is
corresponding DBDJ accession no. and RGP clone ID.
A gene with identity or significant homology to a protein
significant homology to any protein name to indicate the homology lovel
significant homology to any protein bact mane with a gene without
significant homology to any protein.
The orientation of the sequence is from Milzev to -21Mi3 of the BAC
Clone. This sequence of Bl147A04 clone has an overlap with P0431G06
(DDBJ: AP003683) clone at the position 141,300 to 142,270 of
P0431G06. Detailed information on overlap and assembly quality
together with annotation of this entry is available at
thetp://rgp.dna.affrc.go.jp/cenomeSeq.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /cocolistal.c=naba6187.1"

The nuclocitide sequence of this BAC clone was generated by
Combining Monsanto and RGP-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the combining Monsanto and RGP-Japan sequence of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* Location/Qualifiers

// Corganism="Oryza sativa (japonica cultivar-group)"
